Course Description A second course in Abstract Algebra, focusing on Galois Theory, the algebraic theory of fields and polynomial equations. Introduces concepts of abstract algebra

used in settling famous historical problems including the problems of angle trisection and duplication of cubes by ruler and compass constructions, and the insolubility of

polynomial equations of the fifth degree by radicals.

Prerequisites MAS 4301

Co-requisites N/A

Rationale and Placement in Curriculum Galois Theory is a showpiece of mathematical unification, bringing together several branches of mathematics, that students have studied in earlier courses, to create a powerful machine for the solution of problems of considerable historical and mathematical importance.

It is an eminently suitable final-year topic for mathematics majors who are attracted by the power of abstract reasoning, and are perhaps thinking of pursuing graduate work in pure mathematics.

Course Objectives -determine irreducibility of polynomials. -understand the algebraic structure of fields generated by roots of polynomials.

-understand the algebraic structure of helds generated by roots of

-compute the Galois groups of polynomial equations.

-apply the Galois correspondence to solve cubic and quartic equations by radicals.

-carry out certain ruler and compass constructions and determine that others are impossible.

Course Textbook(s) and/or Other Assigned Reading Galois Theory, Fourth Edition, by Ian Stewart, CRC press, 2015

Weekly Schedule of Topics Week 1: Classical algebra, Polynomials, roots.

Week 2: Factorization of polynomials, Euclidean algorithm, Fundamental Theorem of Algebra.

Week 3: Field extensions, simple extensions.

Week 4: Algebraic and transcendental extensions.

Week 5: Degree of extensions, the Tower Law.

Week 6: Ruler-and-compass constructions, impossibility proofs.

Original file: Submitted form version 3.pdf

Week 7: The idea behind Galois Theory, historical background.

Week 8: Galois groups, the Galois correspondence.

Week 9: Splitting fields, normality, separablity.

Week 10: The Fundamental Theorem of Galois Theory.

Week 11: Solubility of equations by radicals, radical extensions

Week 12: The general polynomial equation, elementary symmetric polynomials, solving cubic and quartic equations.

Week 13: Finite fields.

Week 14: Algebraically closed fields, Sylow's Theorem.

Week 15: The Fundamental Theorem of Algebra

Grading Scheme Homework will be assigned every two weeks on a Friday and due the next Friday, so there will be about 7 total assignments. The homework will foster mastery over the material covered in class in the previous two weeks. It will include

writing proofs of general propositions and computations of specific examples.

There will be three 50-minute exams. The first two will take place in class on Wednesday during week 5 and week 10. The third exam will take place during the class's final exam slot.

The three exams are weighted equally and are not cumulative. The three exams constitute 80% of the and the homework is 20%. The grade ranges for

total scores are:

93-100% A, 90-92% A-, 88-89%B+, 83-87% B, 80-82% B-, 78-79% C+,73-77% C, 70-72% C-, 60-69% D, <60% E.
